

## Notes:

This revised edition includes new information for building the greenhouse using either 2x3 or 2x4 lumber. I have included new detail framing drawings, cut lists and templates specifically for 2x4 construction in the back of the book.

On the pages with assembly instructions in each section I have noted the part length change when building with 2x4's by showing the dimension in a box shown as  $23\frac{1}{8}$ ". If building with 2x3's you can ignore these dimension, but if you chose to build using 2x4's be sure to cut parts to the lengths noted in the boxes for proper fit and construction.

This revised edition also includes optional roof vents. They are easy to construct and will allow more ventilation on those extremely hot days. You can add as many as you like depending on how much extra ventilation you may require.

As always, if you have any questions or comments, feel free to email me at [rob@rjtdesigns.com](mailto:rob@rjtdesigns.com).
