

## Detail Drawing: Optional Roof Vent

An additional roof vent can be added to allow even more ventilation on extremely hot days. The roof vent can be constructed out of 2x2's, 2x3's or whatever lumber you have left over after building the greenhouse. The vent should be 24" long and 24" or 48" wide as shown in the drawing on the following page. You can add a single vent or multiple vents depending on how much extra ventilation you may need.

Add cross bars between the rafters where you will be installing the vent. Construct the roof vent, cover with plastic greenhouse covering and attach with hinges as shown below. You can attach a prop to keep the vent open.
